NP Labs at TRECVID 2026:
Experiments with Off-the-Shelf Video QA Models

Task: Video Question Answering (VQA)

Presentation mode: In person

Abstract

Our TRECVID 2026 VQA participation explored how to build video question-answering submissions using open-weight Qwen models and paid Gemini inference, without task-specific training.

Answer generation. Across four runs, we tried sampled frames, speech transcripts, audio-video inputs, and combinations of answers from different models.

Multiple choice. Four runs explored a practical choice: reuse an answer generated earlier, or return to the video with the answer options available.

The talk will present these approaches and their official results, with a focus on where the submitted runs succeeded and failed. We will discuss question types that remained difficult, including counting, and use selected examples to compare answers from open-weight and paid models. These examples will illustrate differences between the approaches and motivate further experiments.
